News Desk

Display stands at the Toy and Hobby trade exhibition.

Toy trade moves into computers

THE 1983 British Toy and Hobby trade exhibition has now come and gone — leaving behind three new micro-computer systems.

Considering the recession that has settled over the UK toy industry in recent years, the trade show was a flamboyant affair. Almost 500 exhibitors took part, filling the whole of the Earl's Court Ex-

hibition Hall on two levels.

Apart from the traditional toy areas, this year's fair showed the first signs of the fundamental changes taking place in the industry as the computer and video games boom begins to take hold.

Well known games machine manufacturers were there — Atari and Mattel — and both

Continued on page 5 col 1

Mattel enters micro market

MATTEL, the American company behind the Intellivision video games system, has announced that it is to move into the home computer market.

The company is to launch a new computer system, the Aquarius, and is also to sell a range of add-ons which will give the Intellivision computing power.

The Aquarius is a Z80A-based machine with full-size integral keyboard and 4K Ram, expandable to 52K in 4K or 16K modules. It has 16 colours, three sound channels, and 256 graphics characters. Running Microsoft Basic, the display is both upper and lower case in a 40 × 24 character format — 320 × 192 pixels.

The machine will cost in the range £120 to £139, and be available in September.

A range of add-ons is also planned for the Aquarius. At the time of launch a dedicated thermal printer, cassette player, and mini expansion unit will be available. The

See us at the ZX Microfair!

If you own a ZX81 or SPECTRUM — or if you're thinking of buying for the first time — the **ZX MICROFAIR** is not to be missed!

There's literally everything for the beginner, amateur, enthusiast and professional.

A fantastic range of products from both the established manufacturers and the newer ones!

There's a bring and buy sale and a complete show guide available on the day.

It's a good day out and the opportunity of learning everything there is to know about ZX Computers.

The facilities at the hall include Bar, Restaurant and lots of seating!

Make a note of it now, or write to Mike Johnston, 71 Park Lane, London N17 0HG for advance tickets (Cheques etc made payable to ZX MICROFAIR and please enclose S.A.E.)

At 80p for adults and 50p for kids (under 14) it must be a bargain!

How to submit articles

Articles which are submitted for publication
should not be more than 3,000 words long. The
articles, and any accompanying programs,
should be original. It is breaking the law of
copyright to copy programs out of other maga-
zines and submit them here — so please do not
be tempted.

All submissions should be typed and a double
space should be left between each line. Please
leave wide margins.

Programs should, whenever possible, be
computer printed.

We cannot guarantee to return every submit-
ted article or program, so please keep a copy. If
you want to have your program returned you
must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any
responsibility for any errors in programs we
publish, although we will always try our best to
make sure programs work.

Editorial

In a letter to *The Times* (February 3),
Clive Sinclair argued for the establish-
ment of a free port in Dundee.

The basis of Sinclair's argument is
that he has to pay 17 percent duty on
semiconductors imported from outside
the EEC. This compares with a duty of
just 5 percent charged on completed
computers that are imported from non-
EEC countries. The net result is to
place Sinclair at a distinct disadvan-
tage *vis-à-vis* his foreign competitors.

In the absence of any sign from the
government that it is willing to remove
the duty on semiconductors, it makes
sense to establish a free port. This
would allow Sinclair to import semi-
conductors, provided they were all
subsequently exported, without
paying the 17 percent duty. British
built Sinclair micros would then be
able to compete with their foreign
competitors on at least equal terms.

Sinclair estimates that the establish-
ment of a free port in Dundee would
generate hundreds of extra jobs, just
to meet the needs of his company.

Unfortunately, the Customs and Ex-
cise Board is against the idea of free
ports. The Board cannot see that free
ports would serve any useful purpose.

Who do they think they are kidding?

Next Thursday

Toy trade moves

Continued from page 1 col 3

had new machines to show. Atari displayed the 5200 games machine — the successor to the Atari VCS. Mattel moved into the computer market with two ranges — computer add-ons for the Intellivision System and a new computer — the Aquarius.

Two other computers were seen for the first time in Britain — the Grandstand Computer from the Japanese company Tomy, and the Creativision System from Video Technology.

Computer manufacturers were also represented — Commodore and Dragon. Commodore showed the Vic20 and the 64, the latter with a hi-fi sound add-on.

Into the leisure zone

CREATIVISION is a new modular home computer system that builds up from a basic games machine into a sophisticated personal computer.

The starter unit is a 6502A-based machine, running 12K Rom Microsoft Basic with 16 colours, four sound channels (three music, one noise) and 16K Ram. The screen display format is 28 x 24 characters and 256 x 192 pixels.

A wide range of extension modules can be added, simply by clipping them together.

Among the options are: 16K memory expansion units (£39) — expandable up to 64K, cassette drive (£39.95), RS232 and Centronic interfaces (£39 each), modem and disc drive.

At the time of launch an extensive range of software will be available. Extended Microsoft Basic will be available in Rom. Games in Rom will be priced at £19.95 each. Cassette software will be launched in several areas — games, education, home and business applications.

V-Tech, a division of Leicester-Zone, was set up last year to develop electronic consumer products. The company

Mattel takes on the computer market

Continued from page 1 col 4

Aquarius has one expansion port — for either a Rom cartridge or expansion Ram — into which the mini expander fits giving two expansion ports — cost around £50.

Other peripherals will follow in 1984 — floppy disc drive, modem and a Master Expansion Module giving Extended Microsoft Basic and two hand controllers.

Software for the Aquarius is aimed at home management, education and entertainment. Initially, Logo will be available on Rom, home finance, file handling packages, and the best of the games titles presently on the Intellivision, will appear.

At the same time, in September, Mattel will launch its Entertainment Computer System — a range of add-ons for the Intellivision system giving the games machine a computing capability.

The central unit of the new system is the Intellivision Computer Adaptor. This module plugs into the Rom port on the games machine giving it 2K of additional Ram, Microsoft Basic in 12K Rom and a full-size full-travel keyboard. It will also provide additional sound channels, bringing the total to six. An RS232 interface on the unit allows a printer or modem to be connected.

The Computer Adaptor will sell for substantially less than £100.

Several other add-on units can be connected to the Adaptor: A Music Synthesizer 49-key full-size music keyboard add-on will cost around £80; two extra hand controllers can be connected allowing four

is headed by Kenneth Lasky, formerly Managing Director of the Laskys Hi-Fi chain, and Richard Abbott, formerly Merchandise Director of Dixons Retail Division.

The Creativision computer system will be launched in June and will cost £99.95.

player games; and the Program Expander unit gives an additional 16K Ram and 8K Rom with Microsoft Extended Basic — cost around £50.

Mattel's European Marketing Manager, Peter Fitters, explains: "The Intellivision system, originally launched in

1980, was always a modular system designed to expand far above the games market. With the new computer add-ons people can go step by step — when they want to begin computing they can build up a home computer."

Cartridge software — which plugs into the Rom port on the Computer Adaptor — will include a Basic teaching package and games based on the Flintstones and Scooby-Doo characters.

New machine from Japan

TOMY, the Japanese toy manufacturer, is to market its 16-bit microcomputer in the UK.

To be called the Grandstand Computer, it has 16K Rom, 16K Ram and a full-size keyboard. The machine is based around the TMS 99/98 chip and has a 256 x 192 pixel resolution which is dot-addressable in 16 colours.

It is unusual in that it has three modes of operation — a Basic programming mode, a Rom cartridge playing mode, and a graphics drawing mode.

The Basic mode has only 19 Basic commands but this can be up-graded to provide a more extensive programming capability. The up-grade also allows a printer and floppy disc drive to be connected.

The Rom cartridge mode converts the machine into a sophisticated games machine. Games cartridges will cost £9.95.

The Graphics mode offers a quick way of defining characters and producing simple

animation. In the lower, smaller part of the display an 8 x 8 character display can be programmed, one colour per square. This can then be converted into a single user-defined character on the main display located according to the position of a cursor. In this way the whole of the main screen can be defined. In addition, four 16 x 16 pixel sprites can be defined — two programmable from the keyboard, two moveable by games paddles.

The Grandstand Computer is being distributed by Adam Computer Systems. The basic machine will be available in the summer, priced around £160.

Commodore soundbox

MICROTRADING has designed what it calls a Hi-Res Soundbox for the Commodore 64 machine.

The unit gives the computer high quality sound reproduction and incorporates two loudspeaker drive units. It will

accurately reproduce notes between 50Hz and 10kHz at an output of 10 Watts RMS.

The soundbox is available from Microtrading, 641 Bromford Lane, Ward End, Birmingham, priced at £49.45 including VAT.

ROMIK SOFTWARE

24 Church Street, Slough SL1 1PT. Telephone: Slough (STD 0753) 71535

SHARK ATTACK

For unexpanded Vic20

You are in shark-infested waters after being thrown overboard from a pirate ship. Your only protection being an atomic net which you trail behind you, trying to cover all the visible ocean and ensnare the sharks at the same time. Beware of stopping or covering your tracks for too long, if you do, then the sharks will escape and come after you. Watch out for the ever increasing deadly octopuses (sometimes the sharks will eat part or all of one!).

MOONS OF JUPITER

For expanded Vic20, 3E, 4E or 10K

You are the Commander of a fleet of destroyers looking on from the safety of a mother ship, you send in one destroyer at a time to blast a passage through the MOONS OF JUPITER. Your destroyers have to dodge, and blast the UFOs... Watch out for the Slogas they can smash your destroyers, but you cannot harm them.

A Machine Code

Armed Quality Game

SEA INVASION

Unexpanded Vic20

Fight off the attacking sea creatures for as long as you can. Shoot the whale for a surprise score, watch out for the crabs, starfish and octopuses.

MARTIAN RAIDER

For unexpanded Vic20

Skim as close as you dare to the surface of the planet, devastating the Martian cities, destroying ammunition dumps (gaining more time), shooting down the ground-to-air missiles.

SPECIAL OFFER

C4 COMPUTER CASSETTES

£2.00 for 10; £20 for 100

Available post free from the above address only

ROMIK PROMISE A MINIMUM OF ONE NEW GAME EVERY MONTH

MULTISOUND SYNTHESIZER

For the unexpanded Vic20

The Vic Multisound Synthesizer is very flexible and can be played in more ways than can ever be explained here, to create music and special effects. For example, create any tune, up to 255 notes (after following appropriate instructions), then press "F1" or "F5", then key "9" and enjoy the added effect. Now hit "←" to listen to the difference. For a surprise — hit "→". Now add a melody over the top — hit key "8" then "7" — now play a melody, or superimpose. Have fun!

MIND TWISTERS

For unexpanded Vic20

Four games to stretch your brain: Blackjack, Decoder, Four Thought and Teaser are our computerised versions of very popular home games and will test your mental agility and skill for many a long hour.

SPACE ATTACK

For the unexpanded Vic20

Space Attack is a game of skill. You are the pilot of an intergalactic battleship have to light your way through waves after waves of various alien spaceships.

ALL PROGRAMS ARE £9.95

DIADON-TREK

£9.95

A real time version of the classic space game featuring full colour tactical status and long-range scanner displays, hyperprobes, the Florida Queen, Klingons and Klingon commanders, tractor beams, enemy movement, black holes and much more. Choose from ten levels of difficulty and three sizes of galaxy. Comes complete with 16-page flight manual. JOYSTICK (1) REQUIRED. Dragon Data Approved

WIZARD WAR

£7.95

A game of magical combat between the Wizards of the Tri-Suns for supremacy of the planet Xarg. Both dexterity and deduction are needed in order to outwit your opponent as spell is traded against spell. Comes complete with 12-page illustrated spell book. JOYSTICKS (2) REQUIRED. Dragon Data Approved

GOLF

£7.95

An accurate interpretation of the game of golf written by a keen club player. Allows match play between two players, as one player may play using the Stableford points system widely used for competition golf. Features full club selection, hazards, out of bounds and player handicaps. Dragon Data Approved

GRAND PRIX

£7.95

Do you have the potential to be a champion Formula One driver? Find out, when your race on these 8 famous grand prix circuits from around the world. For 1 or 2 players. JOYSTICKS (2) REQUIRED. Dragon Data Approved

GAMES COMPENDIUM D1

£7.95

Six great games for the whole family — Donkey Derby, Blackjack, Kingdom, Hunt the Wumpus, Noughts and Crosses and Lunaz Lander. Dragon Data Approved

VULCAN NOUGHTS AND CROSSES

£7.95

A three-dimensional game of noughts and crosses for one or two players. Also includes a zero player option where the machine plays itself. Can you out-think your Dragon? Dragon Data Approved

THE EDG GRAPHICS PACKAGE £24.95

FOR THE BBC MODEL 'B' microcomputer

An advanced picture drawing system developed by a firm of consulting engineers to the oil and utility industries world-wide. Uses cassette tapes for software and picture storage and is controlled entirely by normal keyboard input — no extra hardware required. The main system features are:

- * Picture drawing in model 0, 1 or 2
- * Actual and Logical colour changes at any time
- * Drawing functions:
 - Lines, boxes, circles, arcs, text, shape repetition
- * Drawing aids: Grid, elastic band, save and home cursor (5 positions)
- * Colour fill
- * Text window showing x,y cursor position, length, angle, colour menu and current colour
- * Saving and Loading of picture using cassette tapes
- * Multi-file pictures facilitating very complex drawings
- * Flashing cross-hairs cursor
- * User instructions/prompts

This package comes complete with a spiral bound manual.

Send SAE for catalogue of our full range of Dragon and BBC model B software. Cheques or postal orders payable to Salamander Software.

27 Ditchling Rise, Brighton, East Sussex BN1 4QL. Tel: 0273 771942.

Please add 50 pence P & P to all orders.

Dealer enquiries welcome. Programmers wanted: Good royalties paid.

The programmer is helped though

We wish to make a number of comments about your review of our LMX Eprom Programmer, *Popular Computing Weekly*, 16/23 December.

Firstly, in the opening paragraph, the reviewer points out that the LMX was designed for use with a 1K ZX81. Later he states that the LMX software produces a peculiar display when the 16K Ram-pack is attached. The size of the 1K ZX81 display file varies according to the number of characters currently required. By careful calculation it is possible to display an image in the centre of the screen without padding out blank lines with spaces. This technique is used in the LMX software because memory is at a premium with the minimum system. The reviewer must have been aware of this and yet, in spite of his opening remarks, felt bound to make this unhelpful comment.

Secondly, the LMX software was specifically written so that code could be entered in hexadecimal. Hexadecimal, we believe, is the natural base for machine code programmers to use. It is our belief that serious machine code programmers would not program in decimal. The reviewer's comments that code would have to be converted from decimal to hexadecimal before it could be entered shows that he has little experience of machine code programming.

Thirdly, unless an assembler is available, it is inevitable that code has to be entered a byte at a time. Even if other software is developed so that the LMX can be used, as a programmer, with the 16K Ram-pack, loading bytes into an array, as the reviewer suggested, and then transferring them into Eprom still means that each byte has to be individually entered at some stage.

J W Terrell
Lander Microsystems
32 Clockhouse Lane
Collier Row
Romford
Essex RM5 3QJ

Stephen Adams replies: The use of Print At routines would make it work on 16K and 1K ZX81s with no great increase in code.

Hexadecimal is useful for the programmer as it limits the number of digits printed and so can be easily formatted. Basic and Assemblers are increasingly being used to make machine code writing simpler than using Hex. As there were plenty of spare bytes it was a pity that this was not available as an option.

Code does have to be entered one byte at a time. But only proven programs go into Eproms and these can be loaded from tape. These can be quite long and a method for dumping code from program into Eprom would have been time saving.

Misleading advertising

I am writing to get your readers' reactions to Sinclair's latest advertisement for the Spectrum Microdrive. The advertisement has now been amended to include a section stating that in order to connect the Microdrive, you will also need a controller unit, at a further cost of about £30.

To announce this at such a late stage, when all previous advertisements implied that the Microdrive could be simply connected for around £50 is, I think, deliberately misleading to those people who bought the Spectrum on the promise of the Microdrive. OK so the RS232 interface and network unit will be incorporated into the controller, but that is no consolation if you did not want these in the first place.

Personally, I am very annoyed, but I thought even Sinclair, whose advertisements have been misleading in the past, would not play such a trick on the people who are keeping him in business.

High speed not recommended

I am writing with regard to the letter published in Issue No 35 from Dickon Smith, where he asks about speeding up the Dragon by Poking location 65495.

In my article, published in Issue No 32, I explained the use of three of the SAM regis-

ters used in setting graphics modes. Location FFD7H (65495) is used to 'set' the register R0 to one. There are two registers R0 and R1 which are used to set the timing of the cpu: R0 'set' and the cpu runs at 1.8 mhz — twice its normal speed.

To reset the speed, the register must be cleared. This is achieved by, Poke &HFFD6, 0.

Finally, by changing this register the Dragon's 6809E cpu is forced to run at double its normal speed. This is a feature of the "off-the-shelf" SAM chip, but the Dragon is not designed to run at this speed. Therefore, I do not recommend its use to speed up games etc.

Slowing down problems

I was interested in reading I Dickon Smith's letter (*Popular Computing Weekly*, December 16, 1982) on the problem of returning to normal speed on the Dragon 32. It is true that Poke 65495,X (where X can be any integer between 0 and 255) increases the speed of the Dragon, by 73 percent, to be exact, and that Poke 65494,X returns it to normal speed.

In comparing the Tandy Colour computer with the Dragon I came up with the following information which I hope will be useful to other Dragon owners.

The Tandy stores its Basic commands, as does the Dragon, as tokens. However, Print is 159 on the Dragon and 182 on the Tandy so loading Tandy tapes is impossible, unless you get your friendly Tandy dealer to dump the program in Ascii format, Csave"", A command and load with the Cload"", A command.

The keyboard reading is also different. So programs which use Peek to scan the keyboard will not work or will return with the wrong key number.

Those who write graphics games but do not have joysticks can use the arrow keys to move an object. The continual need to press the keys is irri-

tating. So I came up with the following short subroutine.

```
1000 FOR K=0 TO 4:L=PEEK
(314+K): IF L<>223 THEN NEXT
K:NO KEY PRESSED GOTO...
1010 ON K+1 GOTO 1012,1014,
1016,1018,1020
1012:UP ARROW PRESSED
1014:DOWN ARROW PRESSED
1016:LEFT ARROW PRESSED
1018:RIGHT ARROW PRESSED
1020:SPACE-BAR PRESSED
```

We can't print what isn't sent

In November I bought an Atari 400 for my birthday. Since then I have not been able to find any games for it in *Popular Computing Weekly*.

Will you please print some games. If you do you will be one of the first magazines to do so.

Amir Anvarzadeh
4 Wymondham Court
St John's Wood Park
London NW8

As yet we are simply not being sent enough good Atari programs to publish them on a regular basis in the magazine. If there are as many Atari owners out there as the manufacturers claim, why don't any of you send in any programs?

Micros in the building trade

We are looking for a computer program for use in handling and calculating heating and cooling loads for building structures for use by us as a means of simplifying calculations.

Can anyone help?

The Cavern

A new game for 16K Spectrum by David Leitch

The supply ship 'Caligulos' hovered gently in the night sky. Camak gazed solemnly down at the bleak surface of the planet below as the low-power lighting switched itself on, turning his face a pallid green. Three hours ago the ship's main generator had exploded, rendering the hyper-drive useless. Without the drive, the chances of the ship's crew seeing their mother planet again were extremely remote.

But there was an answer.

Deep in the planet's bowels lay the sacred temple of the Druidians, a people shrouded in a deeply woven cloth of mysticism; it was even believed that they had found the secret of Eternal Life. The Temple contained the objects of their worship, the 'Crystals of Yoth', otherwise known as Dridimonds in Camak's galaxy, the main power source of the now disabled drive. Camak's task was to dig down into

the planet, enter the Temple, steal the Dridimonds and escape. Easy?

The Caverns were patrolled by Guardians who were telepathically linked to each other so that if one was killed another could appear instantly from anywhere. There were booby traps. Camak's ship could only stay in orbit for a limited time. Camak also knew that if he resurfaced without the Dridimonds he would not be allowed on board. Still easy?

A faint humming filled Camak's ears — the ship had landed.

It was time.

Pardon me for interrupting this gripping tale while I describe the program. You must guide your little white man down into the Cavern and collect the Jewels therein. You can move through the green and

black chequered walls and along the black passages, but not through the yellow walls.

You should, by now, have noticed that a little yellow Guardian is following you. He can only traverse the passages and anything, except a chalice, will block his path. You can also throw pitch-forks at the Guardians (see Program for Instructions). To collect a Jewel just cross over it... I will leave you to discover what happens in the two inner Caverns.

Your score is displayed continuously and the time ticks away at the top of the screen; you must return to your ship with some Jewels before it runs out; failure will forfeit all your lives. Exterminating a Guardian on Level 2 and above may result in him dropping a chalice. This will gain an extra life for you.

Remember. A Guardian is replaced immediately. From Anywhere.

ZX81 & Spectrum Games

Chess 1.4: Ten levels m/c graphic screen display.

16K ZX81 £8.95

Invaders: Very fast m/c action. Includes mystery ship and increasingly difficult screens.

16K ZX81 £4.45

Mazeman: A fast action m/c game that reproduces the spirit of the original. The Spectrum version includes excellent graphics.

16K ZX81 £4.45 - Spectrum £4.95

Can also be used with AGF joystick.

Adventure 1: Based on the original game by Crowther, this game was the start of the Adventure craze. Reviewed Sinclair User, issue 1. Features Save game routine as the game can literally take months to complete.

16K ZX81 £8.95 - 48K Spectrum £9.95

See us at the 5th ZX Microfair.

We have full stock of all programs and supply by return of post (which is included in the price)

DRAGON 32 SOFTWARE

EDITOR-ASSEMBLER - MONITOR

Assembler functions include ORG, FC8, FDB, FCC, EQU, RMB and Hex or Decimal addition/subtraction. The ASSEMBLER is of the Two pass Global type. Monitor contains useful routines enabling the user to write and run machine code programs. Supplied on cassette - user manual £27.65

D.B.T.1

Contains five super games. DTHELLO, BREAKOUT, AWARI, MOONLANDER and RAFFLES.

Fascinating entertainment for all the family.

Only £5.75

D.B.T.4 M-code.

PTERODACTYL. Destroy all the Eggs before they hatch. Beat off the attacking PTERODACTYLS.

TORPEDO RUN. Similar to the ARCADE version. 30 perspective. Ships further away give higher points.

HORNETS. Very fast game. Kill the HORNETS as they emerge, but beware when angry they

swamp down firing "snags". All three games only £6.95

DISASSEMBLER. The ideal tool to have around. Disassemble the BASIC to see how it works. Make use of subroutines, etc.

Supplied on cassette £11.88

D.B.T.2

M-Code games. **SNAKES.** Kill them before they kill you. Up to 12 giant snakes at one time.

LANDER. Land your craft on the Lunar surface.

INVADERS. 85 Invaders, mother ship, 3

defenders, 9 skill levels. All three games in

HI-RES - sound. £8.95

CHESS M-Code.

8 Selectable levels of play.

Hi-Resolution display of board and pieces.

Cursor control 'move' selection.

Specific pieces may be set up to solve chess

problems.

Supplied on cassette + instructions. £7.95

ALL ORDERS INCLUSIVE. SAME DAY DESPATCH. SEND S.A.E. FOR LIST

THE DRAGON DUNGEON

DRAGON STICKS!

Top quality joysticks, for the Dragon owner who demands arcade action. Ultra-sensitive, but tough and reliable, Dragon Sticks will keep on zapping when others fail! £19.95 per pair inclusive VAT and postage.

DRAGON'S TEETH

The Dragon Owners' Club monthly newsletter is packed with news, reviews and information for the dedicated Dragon-basher. The Dungeon Master has discarded his scrolls and is busily hammering your letters and tips into his new word-processor. He still needs lots of "gen" to complete his Memory Map and is anxious to hear of the latest bugs spotted to finish off the Manual Corrections Sheet.

The March issue of Dragon's Teeth, due out late February, will include both hardware and software offers and Club Members registering before 31st March will be eligible to purchase Dragon badges and sweatshirt at very special prices.

Annual membership, including Dragon's Teeth £6 (six-month trial subscription £3.25).

The Dungeon vaults are filled with peripherals, software, books and other goodies exclusively for the Dragon 32 owner - from cassette recorder leads, custom-made dust covers and Hi-Res Planning Pads to T-shirts, stickers and badges.

We don't claim to supply all the software available for your pet Dragon (apologies Commodore!) just the best! Current best-seller: Salamander's superb Dragon: Trek.

Send for the current "Take Inventory" listing.

Oric comes alive

David Kelly talks to Paul Johnson, hardware designer of the Oric 1.

Now that the Oric 1 microcomputer has been adopted by the W H Smith chain it seems likely that we shall be seeing quite a lot more of the machine.

At just under £100 for the 8-colour 16K version, the micro looks to have a  going for it — providing early manufacturing and delivery problems can be sorted out.

The machine is a joint venture between Tangerine Computer Systems and a new company, Oric Products International, backed by British Car Auctions.

Home for Oric is Coworth Park, an imposing stately home, set in 500 acres of parkland, just outside Ascot. Paul Johnson — technical director of Oric — explained how the project began: "The Oric was first conceived by John Tullis — back in the spring of last year. He had been employed as a financial consultant at Tangerine. While he was with us he came up with the idea for a home micro.

"As far as the specifications were concerned, we realised we would have to develop a machine at the very low-cost end of the market. There were far too many computers at the business end and, at that time, the only manufacturer of home micros was Sinclair. "Then, just as we started to look at the idea in more detail, the Spectrum came out."

From that point on, Tangerine knew what they were competing with. The new computer was to have Basic, colour, sound and a full-size keyboard.

"We gave it  Centronics interface as standard, so that people don't have to wait until we come out with a printer — they can connect up any other printer instead. We also put in an RGB monitor output. Both the Centronics and RGB outputs cost next to nothing to include — so why don't other companies do it?"

"We stuck with the 6502 processor — which we used on the MicroTan — because it's probably the world's best selling chip. Besides, we have lots of experience

Paul Johnson — Oric Technical Director.

with it and software for it has already been built up. For example, we can quite easily modify the MicroTan disc operating system to run on the Oric.

"To make sure the sound on the Oric was good we gave it the GI8912 sound chip — that's the one most arcade machines use — anything you hear  the arcades you should get on your Oric.

Unlike most Z80-based machines, the Oric has  colour resolution of 1 x  pixels. The Spectrum — for example — can take only two colours .

"The most exciting thing for me about the Oric" says Paul "is its serial attributes capability. It will be invaluable in fast games to save memory. If you want a laser Zap on the screen — like in *Galaxians* — you *Poke* the two attributes at the start and finish of the laser Zap and the computer will join up the line.

One  the reasons the Oric  priced so low is the number of chips it contains. By using 64K DRAM chips the 48K Oric only needs eight memory chips.

Another key feature of the design is the gate array, designed by Paul. This large chip is the "hardware master". Simply, what it does is to control what goes into the processor, and when. The clock timer from the CPU is fed into the gate array and it

uses this to organise all the video output, to carry out all the address multiplexing for the memory and in so doing to control the CPU.

"As a starting point, I knew that we wanted a videodata compatible display. "We did the TTL version back in the summer. I designed it in my study at home — I just had to get away from the phone!"

"Once you have the TTL version working, you know the logic is OK. Then I went to the US to California Devices Inc, who were going to do the CMOS arrays. CMOS technology is different from TTL, so we first laid the thing out as a plan to see where the problems would be. Then we did a simulation of a new logic diagram and worked out the timing paths."

Tangerine had the first Oric working as long ago as August last year, using TTL emulators in place of the finished gate arrays. "When the first finished gate array chips came through from California Devices in early December we took out the emulator, plugged in the chip and it worked first time.  was quite a relief!"

One innovative part of the Oric is its digital PAL colour video encoder. This is the part of the micro which puts the correct colours on the screen  the correct places.

"My PhD is in high-speed analogue to digital converters for use in digital television" explained Paul. "So I just went back to my notes and genned back up. "The beauty of the digital system is that it is  done with integrated circuits.

"As well as being a great games machine,  lot of businessmen will buy the Oric  learn about computing. Some of them will go on to invest maybe £20,000  a larger system but, for the corner sweet-shop the Oric is all that is needed.

"Orics will not, however, be used to run a multi-million pound business or  nuclear power station" grinned Paul.

In the latter case one can only hope that he is right!

Tangerine team: (Left to right) Peter Halford (Software), Andy Brown, Chris Shaw, Barry Muncaster (Director of Tangerine and Oric) and Paul Kaufman (Software).

Little Brother throws down the gauntlet

Tony Bridge looks at some of the latest software to come on the market for the ZX81.

For a while, after the Spectrum was announced, the flood of software for the ZX81 slowed to a mere trickle. Now with the delays in delivery, and the stiff competition making people think twice before investing, software houses have taken heart, and once again come on stream with products for Little Brother.

This latest batch of software is rather a varied one. There is the usual majority of games, but there is also the odd, interesting program of a more serious nature.

First up is *The Gauntlet*, from Colourmatic Computing. A very colourful cassette box contains a version of *Scrambler*. Once loaded, good attention-getting graphics wait for the "1- or 2-player?" input. The keys used for movement (Q, W, A and S) are fairly well grouped, although the wider spacing of W, A, D and X would probably have been even better on the '81's small keyboard.

The program runs in a rather jerky fashion but the game is good, with a number of features, including five or six airlocks (I'm rather hazy on this point, never having reached such dizzy heights!). There is a high-score table, which may be saved on tape for future games, although inexplicably the table has no accommodation for names. Full use is made of the '81's character set in the very healthy explosions. Good documentation and packaging, together with excellent game mechanics, make this highly addictive game very good value for money.

From Computer Rentals, of London, come three games. *North Sea Trawler* is a novel graphic Management game. As the name suggests, you are the captain of a trawler doomed to fish the seas off the north-east coast of Scotland. Whilst dodging various natural hazards in the waters, and undergoing strikes, engine breakdown, crew incompetence and so on, you must net a good catch and get as much money as you can for your catch. A map of the area is available to you, and summaries of your inventory, with prevailing prices at the ports.

The Keys of Gondrun is, as you may surmise from the name, an adventure game. A novel feature of this program is the multiple choices available in answer to most situations, thus making it rather easier for clods such as me, who can never seem to find the appropriate word to give the computer.

Galactic Patrol, the final game submitted for review by this company, unfortunately refused to load under any circumstances.

Now here is a chance to win some

money with your ZX81 — as much as £300,000, claims the author of the next program, Mr. Puzzleman. *Lojix* is the name of it, and the author will put £1 for each one sold into a bank account. The first person who solves the puzzle will collect whatever is currently in the account.

Mr. Puzzleman reckons that, as 300,000 ZX81s have been sold in the UK, that is the potential number of pound notes going into the account.

So, how hard is the puzzle? A chess-board has to be covered by a number of irregularly-shaped "pieces", in much the same way as the Pyramid Puzzle, which enjoyed a certain vogue earlier in 1982, or Dr. Bono's well-known L-puzzle. Not only is *Lojix* extremely hard — frustrating even! — but, I'm glad to say, is also one of the most stylish I've seen for the '81, admirably suiting the computer's graphics.

Fortunately, it is also highly addictive, with machine-code responses. I'm now torn between seeing the solution when it is published, to put me out of my misery, and being kept blissfully unaware of the solution, so as to prolong the life of the puzzle.

If £300,000 is not enough for you, how about a jackpot on the pools? Harland Software promise you at least a good crack at winning the pools using their *Football Forecasting Program*. The results of the '81-'82 season are stored in the program, and the data is used to forecast the results of matches (you may also use your own data, should you wish).

A lot of hard work has gone into the production of this program, so I hesitate to say that, in the two weeks over which I tried it, no score draws were forecast correctly. Two weeks is, of course, too short a time for a meaningful test. I would expect that over the season the Law of Averages would give you a good chance of breaking even.

Staying with the more serious side of ZX software, we come to the products of Saxon Computing. These are *Database Manager* and *Forecasting/Graphs* (*Time Series Analyser*). The tapes come with comprehensive documentation, although the section dealing with suggested applications for the *Database* program was not forthcoming as promised, at least in the review copy. Data manipulation in the *TSA* program was impressive, with statistics, averages, percentages and so on being calculated from your data.

All the usual features are present in the *Database* program, including Amend, Search, Delete and so on. The authors

Tony Bridge — optimistic about the future of the ZX81.

rightly warn against the program being used in time-wasting exercises such as compiling Personal Telephone Directories, which are more easily done with the good old pencil and paper.

Hestacrest is "committed to low cost business software", and to this end has just released two more low-cost tapes to complement their *Accounts* package. The new programs are *Sales Ledger* and *Purchase Ledger*. We received the former for review, and found it to be as excellent as the *Accounts* tape. Full documentation is supplied — typed to keep costs down — and the program itself would be very helpful to a small one-man business in keeping tabs on its finances.

Bridge Software is an established name in the ZX world, and has released two new tapes. *Lynchmob*, which we shall return to in a moment, and, staying in the non-game sector, *Ephemerals*. This is billed as "an observer's guide to the Galaxy". The program asks you, with the aid of nicely laid-out screens, for the present date, time and latitude/longitude.

From these data, the computer then works out, for each planetary body and the Sun, the altitude, azimuth, distance from earth, rise and set times and so on. This is

a good program for home astronomers, taking all the drudgery out of these calculations. An acknowledgement is given to Paul Duffell-Smith's "Practical Astronomy with your Calculator".

Lynchmob brings us back to the games, and is, of course, a version of Hangman, set in the Wild West. There is a good instruction page, and the game itself runs well, with fine graphics depicting an evil-looking cowboy complete with spurs and Abe Lincoln beard.

The *Break* key is not disabled, which is a pity in a program likely to be used by smaller children. However, if *Break* is inadvertently pressed, REM statements are displayed which describe how to get the program going again. As far as I know, this is unique and a practice that other authors should follow.

Saltcoats was immortalised in song by Billy Connolly, when he was half of a group called The Humblebums. Now Saltcoats, in Ayrshire, is immortalised in the annals of ZX software by Messrs Morrison and Anderson. They have produced two tapes of 1K programs, one of which, Tape A, they have sent us for review, together with listings of another 10 which comprise Tape B, naturally enough.

The games are the usual collection of *Asteroids*, *Galaxians*, *Defender*, *Squash*, *Sketch* etc., but containing machine code, as they do, all the games run very fast. Tape B has a more intellectual flavour with *Simon*, *Towers of Hanoi* and *Mastermind* all making an appearance.

There is also, would you believe, a 1K adventure, *Haunted House*. The authors have packed an awful lot into the tiny memory, and the graphics are among the best I've seen yet on a 1K machine — the *Galaxians* game even has a High Score!

Another collection — this time for 16K — comes from Enigma. They've called their tape, *Enigma One*, and it contains six puzzles. Included here are old favourites like *Towers of Hanoi* (again), *Solitaire* and *Flanders Wheel*, along with some new ones as *Dilemma* and *Crossover 6*. The puzzles are all very difficult and feature excellent graphics. Like the Saltcoats collection, this one is extremely good value if you are a devotee of this kind of game, and is probably the definitive collection of cerebral puzzles for the ZX81.

From the sublime to the faintly ridiculous! *Love* is an adventure game from Remsoft. This is a text Adventure "for women" and places you, poor defenceless

creature, in a bedroom in Poke Hall (honest!). You are wearing pyjamas, and have with you a suitcase. All the usual word-inputs are recognised, plus a few non-standard ones, like "Love", "Cry", "Kiss", etc., which will give you a pretty good idea of the general mood of the Adventure.

You are beset on all sides by, no, not monsters of the animal kind, but rather of the human kind. The Rude Sinclair, Mr Ram Pac, and others are trying to seduce you, and another word that you might find useful in these situations — and one which I'm ashamed to say came readily to my mind — is "Undress"! On the practical side, things get a bit tedious, as the words all have to be typed in full. The program is in Basic, but the computer goes into FAST mode after accepting a command, so reaction times are fairly rapid.

So, the program works as an Adventure should: but do women need an adventure such as this? Sexism doesn't often rear its ugly head in the world of computer software — Ms Pacman and that lady frog in Frogger excepted — and I'm not sure that the authors (D. Bollen and H. McEwen) are women anyway!

Se habla español? Now we come to a batch of programs from JSR, a Spanish-based company. Their catalogue of new releases is evenly-spread with games and utility programs.

Super-Graphics Toolkit is the title of the first one and explains itself fairly well. The tape contains the main program together with a demonstration program, and also the main program on its own. The demonstration can quickly be erased, however, when finished with. While most of the other programs came with excellent English instructions, only Spanish instructions were included in this program. My few weeks in Majorca were not enough to cope with translating Sinclair-ese! I could not, therefore, do justice to the program.

The demonstration was very impressive and by the time you read this, JSR will no doubt have produced full instructions for their Graphics toolkit. (es todo?) Just some of the facilities (that I could understand!) are, *Scroll* in any direction, *invert* any character, *Flash* any character, and so on.

Orchestra is an ambitious music/sounds editor that works extremely well. With this program it is possible to produce melodies of up to 3,000 notes from your ZX81 — almost enough for a symphony! The menu will give you six options. After entering your melody, which admittedly is rather

laborious, each individual note and its duration having to be entered, you may then edit to your heart's delight. It is also possible to test between two notes, or repeat just a section of the melody — which you may then ask to be repeated a number of times if required.

You may also change the speed of the whole piece, or duration of individual notes. *Concert* will play back your symphonic efforts, or, alternatively, the melody already stored in the program, which turns out to be Rondo à la Turk. All you need is to turn up your TV's volume. This a truly impressive program.

3D Space Battle is the promising name of the first games program. Upon loading — and, in common with all the other tapes, this program is preceded by a short loading program to get the loading level right — you are presented with a view of the near galaxy from your spacecraft window. The documentation promises that you will then be assailed by bloodthirsty aliens which you have to annihilate with your lasers. Maybe something went wrong in loading the machine code, but I could not get any enemy ships at all!

I fared better with *Alunijaze* (Lunar

Lander) which is a pretty good version of the old favourite. You can choose to land your lunar module on one of three pads on the moon's surface. The easiest route increases your score by a factor of two, whilst taking the most difficult route is rewarded with five times your score. As you get close to the pad, the view is magnified, so that you can really see, in detail, all those little jagged lunar rocks ready to smash your craft to pieces. Your fuel is running out all the time, and your mission is to gain as high a score as possible in the time given.

Unfortunately, there is no high score system so each game is entirely separate. It is, however, a highly addictive game, and I rate it as good value for money. This is a very good first release from this new Spanish company.

Summary

All in all, a pretty optimistic-looking future lies ahead for the ZX81. There is obviously plenty of life left in Little Brother.

Saxon Computing: 3 St Catherine's Drive, Leconfield, North Humberside HU17 7NT.
Mr Puzzleman: 13 Cherry Tree Walk, Newport, Pontyplun, Mid-Glamorgan CP7 8RG.
Remsoft: 18 George Street, Brighton BN2 1RH.
JSR Software: Chalet "Capvespre", Avda de Rhode No. 253, Apartado de Correos No. 168, Rosas (Gerona), Espana.
Heatcrest: PO BOX 19, Leighton Buzzard.
Hartland Software: 6 Penzance Place, London W11.
Bridge Software: 36 Fernwood, Maple Bridge, Stockport, Cheshire.
Enigma: 24 Main Road, Littlehale, Sleaford, Lincolnshire.
Computer Rentals: 140 Whitechapel Road, London E1.
Colourmatic Computing: 40 Longfellow Road, Coventry, W Midlands.

OPEN FORUM

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £5 for each program published.

Pontoon

on Vic-20

This program is written for a Vic20 with at least 3K extra memory. If you have more memory remember to change the screen and colour addresses in the program. In this version of *Pontoon* you play against the computer and the first to go bust is the loser. Your money, Vic's money, the stake, and all the cards dealt so far in one game are shown on the screen.

You always place the bet unless you win a game in which case Vic will

either double the last bet (if he has enough money) or he will put half his money at stake in an attempt to win back money lost. If you get a five-card trick or a straight win (ie, ace, king) then the screen flashes and sound effects are made.

In the program there are two separate packs. The first A\$(i) contains a nice and neat pack of cards. The second pack B\$(i) takes out randomly cards from A\$(i) (checking that none is taken twice) to produce the 'playing' pack. The pack is re-shuffled when the number of cards undealt drops below 12. This can be changed if you want (line 100). The actual cards are shown with

the suit in the middle and the value above it. X is 10, J is Jack, etc.

Program notes

Lines	
15	Display title, set up variables, and wait for you to hit a key.
30 to 90	Set up shuffled deck (B\$).
110 to 135	Draw card subroutine.
200 to 300	Get the values of four cards. Gosub routine to get bets.
345	Subroutine to display value and suit of card.
600 to 700	Subroutine to place bets.
700 to 720	Vic's bankrup!!!
800 to 900	Turn B\$(i) into values/codes for display.
1000 to 1090	Player's turn
1200 to 1290	Vic's turn.
1300 to 1320	Vic wins (five-card trick).
3000	Vic wins.
4000	You win.
4500	Straight win (ie ace, king).
5000	You win (five-card trick).
6000	You lose!!!
POKES	
7600 to 8185	Screen (memory mapped).
36400 to 36884	Colour (memory mapped).
36874 to 36877	Sound generators.
36878	Volume.

Watford Technical Books

Now in stock, **Computer's First Book of Vic**, (£11.95 including p&p) contains many articles from Computer magazine and some previously unpublished. There's a range of material ready to type in — programs and helpful hints, applications and utilities, from games and graphics techniques to a complete listing of TINY-MON — ready to load and occupying just 760 bytes.

Also just in is **Computer's Second Book of Atari** (£11.95 including p&p), which includes Player-Missile Drawing Editor, ready to type in — and many other gems.

If you can't visit Watford and save a little p&p, send SAE for lists or phone. We're open daily 6.00 (Weds 1.00, Sat till 5.00). Access and Visa will do very nicely, thank you, including by phone.

Attack

on Dragon

This program is a game for the Dragon which puts to good use its extensive graphics capabilities. When the game is run a 'defender' type shape appears on the left-hand side of the screen which can fire and be moved up and down by use of the right joystick.

The object of the game is to hit the two objects moving towards you as many times as possible in the time allowed (75 secs). These objects move in both 'sin' and 'cos' curves and score 100 points for

every direct hit.

Your score will be displayed at the end of the game but to give you an indication of how well you are doing during the game, a vertical line will appear in the top left-hand corner of the screen for every hit.

Program notes

Lines	
30	Switches processor into fast mode.
60 to 90	See if instructions are required.
100	Sets mode and clears screen.
110 to 200	Set up screen.
210	Plays start tune.
220	Plays start tune.
230	Reads joystick.
240	Checks to see if time is up.
250 to 300	Calculate positions of enemy objects.
310	PF=shape of objects. (E=\$)

320 to 340	Draw enemy objects.
350	Checks fire button.
360 to 370	Blank out enemy ready for new positions.
380	Plays tune if fire button is pressed.
400 to 440	If y-value ill your ship equals that of the enemy and the fire button is pressed, draw a line between ship and enemy to indicate laser. Also play tune.
450 to 470	If the enemy is not in line with your ship and the fire button is pressed, draw laser going off the screen.
480 to 510	Make sure ship does not go off the screen and see if movement of joystick is large enough to warrant a movement.
530 to 540	If hit then draw explosion.
550 to 580	Draw line at top of screen for every hit.
610	Draw your ship.
630 to 640	Draw and erase your ship.
700	When finished switch processor back to slow mode.

Program follows on page 18

Tables

on Spectrum

This program is designed to allow children to practice their tables by either multiplication or division. Two attempts are permitted at each question before the correct answer is displayed, but the first answer must be correct to score.

It is necessary to enter the same number of digits as the correct answer before the computer will respond. The range of the table may be altered by modification of lines 45 and 280.

Program notes

- Lines
- 30 to 90 Determines type of question.
 - 100 to 110 Sets counter to zero.
 - 130 Notifies if answer correct.
 - 160 to 170 Give final score and allows choice for next test.
 - 190 Inverse video reads WELL DONE YOU GOT FULL MARKS.
 - 190 to 270 Determine choice of next test.
 - 250 Inverse video reads "SCORE "A:" out of "B:"
 - 280 to 340 Set questions and totals questions asked.
 - 350 to 400 Deal with incorrect answers.
 - 370 to 410 Graphics "D".
 - 1090 to 1240 Read keyboard and determine whether answer is correct or not.
 - 2090 to 2950 Create division sign.
 - 2020 Graphics "D".

Morse Code
by Alan Blackham

Sound

on BBC Micro

This program allows full use of the BBC sound commands. A chord can be played at the same time as a noise. Various envelopes have been defined including

piano and mouth organ.

The function keys F1 to F9 have the envelopes. F1 is Piano and F2 is Mouth Organ. Noise can be made by pressing Shift and Z, X, (for pink) and V, B, N for white noise. Try a piano envelope with Shifted V.

The variable K is the number of keys pressed. The array of N stores which notes are pressed. Lines 620-640 stop the program coming to a halt by keeping the sound channels clear. By pressing FO the notes you have played will be repeated. Delete resets the envelopes. The program has a range of two octaves.

Sound
by Robert Lober

Showing up the nature of the character held in the corner

Colin Cattanach presents two programs for searching around in the Vic20 memory.

Character recognition

When poking around in the Vic's memory, one is often uncertain which location a particular character is held in. This program, which incorporates two options, clearly shows the nature of the character held at a particular location, by printing an enlarged version of it at the bottom right-hand corner of the screen, within an area of 160 x 160 pixels.

The \square byte values, which make up each character, are printed for reference, alongside the relevant horizontal rows of dots. In \square second option, one may choose to view every character in an area of memory in turn, together with all the relevant byte data.

The program, as set out (Lines 230-350) will run on an unexpanded Vic. When the program is used with an expanded Vic (of 16K+) for which it was first developed, one must first enter the following one line program.

POKE 44, 32: POKE 648, 30: POKE 8192, 0: NEW:
RUN

Then press the *Run Stop* and *Restore* keys to regain the cursor. This fools the Vic into behaving as the unexpanded version. The program is now fed in, and operates as with the unexpanded Vic.

Byte = 60
Byte = 36
Byte = 36
Byte = 36
Byte = 165
Byte = 165
Byte = 165
Byte = 231

A word of warning. Having placed the program in the computer, be sure to save it on tape before a run. Experimenting with *Poke* commands can crash a program and it is very time-consuming entering  again from the keyboard.

The following additional lines to insert in the program, for use with the expanded Vic, (16K+), illustrate the kind of situation the program may be used to investigate.

```

2 PRINT: PRINT "INSTRUCTIONS FOLLOW IN 11
SECS": FOR I=0 TO 1024: POKE 5120+I, PEEK
(32768+I): NEXT: PRINT
3 PRINT: FOR I=0 TO 1024: READ Q: IF Q= -1
THEN 5
4 POKE 6144+I, Q: NEXT
5 POKE 36889, 253: POKE 36886, PEEK(36886)
OR 128
6 DATA 69, 36, 36, 36, 165, 165, 165, 231, -1
7 FOR N=6137 TO 6144: FOR Y= 6144 TO 6151:
POKE N, PEEK(Y): NEXT: NEXT

```

Line 2 duplicates 128 characters held in Rom in the user's Basic program Ram

from 5120 TO 6144. This area can now be used for programmable characters. Use the program to check the characters now held at say 32768 and 5120. Line 5 commands the Vic to seek characters at location 5120 onwards, rather than in Rom at 32768. Lines 3,4 and 6 have been used to insert a new character at 6144. Again check this by running the program. Line 10 transfers one character from location Y TO N.

The essential part of the program is in

lines 300-350, which converts the decimal value inserted upon demand, to a binary number system, which is printed out to illustrate each line's byte value. The latter is then used to compile the enlarged character with a series of *Poke* values.

Word or Data Search

Word of the Search: This program will print out all the data recorded in your listings or search for and print out all the listings in which a particular word appears.

On a straight run, the program asks for the limits of the chosen area in memory to be viewed. This is then printed out at a rate suitable for scanning. It is often necessary to search for a piece of desired information recorded in memory, whose exact location is forgotten. With a large memory, it would not be convenient to have to scan through all the memory every time. This is

Character recognition

```

where the word Search comes in useful.

On entering *Run 4000*, one is asked to supply the word to be searched for. A systematic search is then carried out of all recorded information, and all sentences containing the word in question are printed out on the screen, with the word highlighted in red.

The program is obviously of more use with an expanded Vic, which has a greater memory capacity for recording information. But by placing less information on file, one can experiment with it using the basic machine. The program as listed takes up about a third of the memory available with the 16K expansion, leaving plenty of room to record more information to search through, using the Word Search procedure.

Lines 52 and 55 ask for the limits of information to be printed out in the straight *Run* mode, pertaining to the area of memory covered by Listings 100-184. The

latter can easily be expanded, of course, providing the routines in lines 10-14 and lines 70-74 are also expanded.

Lines 10-14 direct the operation in hand to the lines of information to be printed on the screen. These are further defined by lines 70-74, which direct exactly which lines are to be printed out between limits of lines 100 and 184. This covers 84 listings or $84 \times 4 = 336$ lines of screen print. With 16K one can easily incorporate 1000 lines of screen print. It is important to ensure that the maximum value of L inserted on demand, line 55, falls within the limits of recorded data, i.e. the D\$ values of lines 100-184. Failure to observe this can lead to annoying hold ups.

Before running the Word Search program, lines 4000-4210, one should ensure that the value 84 in line 4005 represents the maximum number of recorded pieces of information in the listings 100-184 (i.e.

the maximum number of values for D\$). In the initial Word Search, lines 4005-4025 cause every sentence of information to be scanned for the presence of the Desired Word C\$. If this is found, line 4200 prints out the actual listing of the sentence in which the word occurs.

Lines 4201-4203 decide which part of the sentence shall be printed in blue and which shall be in red (the high-lighted word appears in red). Line 4208 prints one letter at a time in blue, and line 4210 prints in red. Line 4204, and also line 60, contains the time delay values T between each sentence printed, and may easily be altered.

After the Word Search and the resulting print on the screen, one is given the option, lines 4100-4114 of a repeat viewing of the same data, (pressing F1), or one is asked for the next word to be searched for (pressing F7).

Type founts galore

Ian Farquharson explains how to create and store your own character sets.

The Spectrum character set, or at least the upper case letters and numbers, was copied across from the ZX81 without any changes. To make any changes to the ZX81 character set, an expensive hardware add-on was required, such as the excellent DK'Tronics unit.

Most Spectrum owners know how to re-define the UDG characters. The only problem with these is their numbers — at most only 21 different shapes may be programmed. This means that you can not create foreign alphabets or new English type faces with more than 21 letters.

There is a way to get around this. If you look at page 173 of the ZX Spectrum Basic manual, at the bottom of the page is a note about the system variable called *Chars*. This is a pointer which holds the address of a byte which is always 256 bytes above where the Spectrum thinks the character set is located. This character set extends from 32 to 127 inclusive and can be sited anywhere in memory.

Having explained the principle I will now show you how to set up your own character table on a free part of the memory.

Firstly, you will need to set up some space for the character table near to the top of your free Ram. This will require 768 bytes of memory. In a 48K machine it is best to begin at 64000 decimal. To protect this area you should execute the command *Clear 63999* which resets the Ram-top so that the area above is kept free from the program and data.

Secondly, you will need to copy the existing character set from its location in Rom into the new character table. (This will not be needed if you are going to re-define the entire set as we will over-write the old set). To relocate the character set the following short Basic program is used.

```
10 FOR Z=16384 TO 16384
20 POKE Z+48384,PEEK Z
30 NEXT Z
```

Thirdly, you can replace certain characters (or all) with your own type-faces by *Poking* in the appropriate eight bit numbers (1-255) to form the rows of your new characters. Remember to enter eight numbers for each character even if they are intended to be blank, as the previous contents will remain in the table and interfere with the new characters. The method of introducing the new characters into the table depends upon how many bytes need to be altered, but for most applications the following Basic program will probably suffice.

```
10 INPUT "Enter start address>:" START
20 CLS
30 FOR Z=START TO 64767
```

```
40 INPUT "Z:" Z
50 LET AS="BIN"+AS
60 POKE Z,VAL AS
70 PRINT Z:
80 POKE Z+62,1
90 NEXT Z
```

This short program requires the user to input the binary string representing the pattern of Ink and Paper pixels with a 1 for Ink and 0 for Paper. Ideally you should have worked out the characters on graph paper beforehand to simplify the process of entering the new characters.

Once you have changed the relevant characters you will want to test out your creations. To do this you must alter *Chars* to point to 63744, which is 256 less than the first character. Because of the location, which is on a 1/4K boundary, you need only alter the most significant byte of this variable. The actual value which needs to be poked is 249 (249x256=63744). To do this type *Poke 23607,249* followed by *Enter*. With luck you should find your new type-face being used in the automatic listing.

If you have made a mistake and set the machine to use a character set which contains just spare bytes or garbage such as the program area, Rom, or a machine routine, you will find that the listing has either disappeared or turned into a mass of grey squares, do not panic. All you need do is type *Poke 23607,60* to restore the pointer to its original position in the Sinclair Rom. You will not be able to see this command as you type it but if you are careful this should not prove difficult.

Once the character set is working correctly you can delete any Basic program as usual with *New*. When this is done the original Sinclair set will be used. You can always restore the programmed table by entering *Poke 23607,249*. The old set may be called up at any time by the command *Poke 23607,60*.

The following data, when entered at the specified locations using the program in the third stage, with line 50 removed, will replace the upper case letters and the numerical set with a futuristic type face which can only be described as similar to those used in the arcade game "Defender".

Numbers 1 to 9 and 0

```
64128 0, 126, 102, 106, 106, 114, 126, 0

```

Once you have your character set safely stored away and working, you will want to save it on tape. To use them in a future session all that is required to be done is clear some memory, load the character table, and set the pointer to it. To do this type *Save "Chars" Code 64000,768* then *Enter*. The whole process should only take a few seconds. Because there is a lot of typing involved in entering the data it would be advisable to verify the data. This is done with *Verify "Chars" Code 64000,768*, which checks the saved data against the data in memory to make sure the saving operation has been properly done.

It should be remembered that this is basically a project for those willing to experiment with the principle. The only fault with this system is that the keywords will also change. It is advisable to turn on the new set at the beginning of the program and to restore it just before you list the program. Doing this will allow you to extend the character set by defining the five characters after Z for both upper and lower case use, but will not corrupt these symbols in the listing.

This program has been written for use on the 48K version of the ZX Spectrum. It could be used on a 16K version with changes to all the addresses which are above 16384. But as you would be left with less than 8K of memory for your own Basic programs, it would limit the use of many commercial programs which have been written tightly into the free memory space of the 16K machine.

Dictionary compiler

3270 The design is now *Drawn* next to the grid, using the new *E\$* which has been created. *Drawing* it at scale 8 ensures that its proportions, though not its size, are the same as the design created on the grid.

3280-3300 The design is displayed until a key is pressed, then control is returned to Module 4. Note that the scale for *Drawing* must be returned to the normal 4 before a *Return* is made, otherwise subsequent use of the *Draw* command will produce over-size results.

Testing

Having defined a design on the grid, you should now be able to call up this module by pressing key 'E' and, after a lengthy pause, see it displayed half scale. Stopping the program will allow you to examine the *E\$* which the module has created. Note that no check is made that your design is not too complex to be drawn by a string of up to 255 characters, so that too full a grid might result in an error, though this is unlikely to happen.

Module 7: Lines 6000-6090

The function of this module is to allow the design which the user has created to be saved on tape in the form of string. You will note that the module is more simple than many of the data file modules of earlier programs, this is because its sole purpose is to save a single string.

Testing

You should now be able to save *E\$* on tape. This can be verified by calling up this module, then stopping the program and clearing the variables. Insert at 8888 a single line instruction to open an input file by the name of *CHAR* and input *E\$*, not forgetting to close the file. You may then print out *E\$* in direct mode, or *DRAW* it to check that it has been satisfactorily recorded and reclaimed. If this is successful then the program is complete and you are ready to proceed to the second half of the high resolution text section.

CHARACTERS: *Summary of single-key functions:*

With cursor flashing:

0 — erases square on grid where cursor is situated.

1 — inks in square on grid where cursor is situated.

R — rotates design within grid by 90 degrees anti-clockwise.

M — calls subroutine which moves design within grid.

I — transforms design within grid into its mirror image.

E — creates string which will duplicate design if *DRAWN*.

— saves design on tape.

The Working Dragon 32, by David Lawrence, costs £5.95 and is available from **Sunshine Books Ltd.**, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

With large "M" drawn to the right of the grid: 1, 2, 3 or 4 — specifying corner towards which design is to be moved.

Summary

This program is an odd one in that, as it stands, it is almost completely useless. That is to say, all it accomplishes is to store strings defining small-scale designs or characters onto tape — hardly a stunning feat. In combination with other programs, however, which will pick up the characters created and compile them into usable character sets, and modules which will allow you to use such character sets easily in high resolution *PModes*, the program becomes an indispensable tool which enables the Dragon to exceed its normal capabilities.

Going further

(1) A character creator is hardly much use unless you are prepared to sit down and define some characters. Though this may seem an incredibly difficult and boring task at first glance, a moment's reflection will suffice to realise that a complete set of characters, already defined in pixels, is laid out before you in the listings given in this book. Alternative styles of lettering can be found in the program listings in any computer magazine. With such examples to work from, you really should have no difficulty building up a collection of worthwhile characters.

(2) The program given does not necessarily always make the best use of the 255 characters of string space available for *E\$*. This is because a blank move always uses the *BM* notation, which requires at least seven characters (*BM+2,-2*) and possibly 9. An interesting challenge would be to insert a routine to test whether such a blank move could be covered by one of the single-letter *Draw* instructions — for in-

stance the blank move given above could just as easily have been defined by "BE2", which would result in a considerable saving.

Dictionary

Having created characters it now only remains for them to combined in such a way as to be useful for subsequent programs. The program which follows is designed to accomplish this by holding in memory up to 100 characters at one time, with the possibility of more being picked up from tape in batches of one hundred. The characters so stored can then be combined into collections such as "ABCDEF-GHI..." etc to provide material for high resolution programs which require text. In later programs we shall examine practical modules for using such character sets without constantly having to specify *DRAW* commands in the program.

MODULE 1: Lines 1000-1150

A standard menu module.

MODULE 2: Lines 1500-1560

This module sets aside sufficient memory for the necessary *PMODE* and reserves the rest of the available memory for strings as well as setting up the necessary variables.

Commentary

1540 The main dictionary of characters will be held in the string array *DI\$*. The number of elements which this array will be capable of holding will depend on the complexity of the characters and, therefore, the length of the strings required to *Draw* them. The character set currently being compiled will be held in the string array *Chars*.

1550 *CI* and *DI* record the number of characters stored in the character set and the dictionary.

?

Don't bother guessing which programs our members are saving money on this month.

If you use a BBC, Dragon, Spectrum, VIC or ZX81 computer and you are not yet a member of THE MICROCOMPUTER SOFTWARE CLUB, then only those with the VIC can be forgiven. We have only just added the VIC to our coverage.

Membership of The Microcomputer Software Club would save you money and trouble. Each month we thoroughly test and evaluate the many programs issued by the growing number of producers - including Pixel, IJK, Bug-Byte, A & F, Campbell, C-Tech, and the smaller companies that you may find it difficult to keep track of. If a program is good, and it has got to be very good, it is recommended to our members in the next issue of the Newsletter.

All the programs that we recommend are made available to our members at very low prices. For example, a Bug-Byte program usually costing £10.00 would be offered to members at £9.00 or less. A saving of at least 10%. Every month we select what, in our opinion, is the overall best program for each computer and this MAIN CHOICE program is offered to members, for one month only, at an average 20% less than the normal price. A MAIN CHOICE program usually costing £6.00 would, therefore, be available to members at about £4.80.

Every month members receive, free of charge, our Newsletter full of information on the programs we have found suitable for recommendation. The range is large, including adventure, arcade, standard games, household, financial, educational, wordprocessing, and utilities. Ordering from the Newsletter is simple and quick and, of course, quality is guaranteed.

JOIN THE CLUB AND WE WILL TELL YOU, FOR FREE

Membership is completely free of charge, and receipt of the Newsletter is automatic. Members are under no obligation to purchase a fixed number of programs from the Club. They buy what they want when they want in the full knowledge that they are buying the best programs at the best prices. So, if you own or use a BBC A or B, Dragon, Spectrum (both versions), VIC (expanded or unexpanded), or ZX81 (16k), join the Club. It will cost you nothing, and save you a lot.

DEMON Machine Code Monitor for DRAGON Computer

What is a Machine Code Monitor?

A monitor is a program which allows access to the low level functions of a computer. Normally a good monitor will allow access to the memory contents and the microprocessor registers as well as the ability to run programs written in machine code. There should be an accessible library of documented subroutines which can be used for developing programs around the monitor.

What can DEMON do?

DEMON has twelve commands

1. A -- Adjust the Microprocessor registers
2. B -- Set breakpoints (up to 12 breakpoints are allowed)
3. E -- Examine memory in either Hexadecimal or Ascii mode
4. F -- Fill memory between two addresses with a constant value
5. G -- Restart a program from the program counter value
6. J -- Restart a program at the supplied address
7. M -- Modify memory contents
8. O -- Memory test
9. R -- Register dump
10. V -- Relocate Video text page
11. X -- Clear breakpoints
12. Z -- Return to BASIC

DEMON does not affect the normal running of BASIC and can be accessed at any time from BASIC. There are fully documented subroutines which allow keyboard input and output to a text page, relocation of video text pages and other useful routines. DEMON subroutines are totally self-contained.

A 6809 instruction summary is supplied with every copy of DEMON giving full details of all the instruction opcodes and their meaning as well as a programming model of the 6809 microprocessor.

The powerful interrupt handling in DEMON allows programs to be easily developed and checked in machine code.

All subroutine entry points are grouped in such a way that DEMON will be fully compatible with other software due to be released by COMPUSENSE.

DEMON -- available from COMPUSENSE or any good dealer price £18.40 including postage.

Order by cheque or ACCESS/VISA by telephone or post.

SPECIAL OFFER

ON ZX81 & SPECTRUM ADVENTURES

MINES OF SATURN: "While plotting a routine orbit of SATURN, you are caught up in a radiation storm which forces you into the giant planet's rings. Your energy drained, you make a forced landing on the planet surface. Luckily you crash near an abandoned mining base and you set off in search of some Di-Lithium crystals to refuel your stranded space-ship. Can you succeed?"

BE WARNED -- THIS IS NOT EASY

RETURN TO EARTH: "Having escaped from your previous dilemma, you reach Earth Station 1, but fail to make radio contact. You effect a safe if harrowing manual docking with the orbital station. On entry you find it deserted, and the control room destroyed. You must explore the station and find some way to alert Earth of your predicament. BEWARE, many of the rooms are identical, there is extensive damage, and signs of Alien intruders. (The sequel to MINES OF SATURN.)

Special offer to readers of Popular Computing Weekly £5.95.

FOR BOTH GAMES POST AND PACKING FREE.

(Programs run on 16K & 48K machines.)

Send now for this fabulous offer, double saved on computer quality cassette, and despatched by return of post (1st class letter), you won't be disappointed.

EASIREADER

"The Greatest Programming Aid
Since Flipgers"

Get down program entry time
Minimize bugs by Minimizing Entry Errors
The EASIREADER is an attractive, high-
quality acrylic plastic stand designed to aid
the casual entry of programs from magazine
listings, pinpoints and most books.

99 percent of bugs in programs copied from
printed listings are the result of entry errors.
The EASIREADER holds the copy at a com-
fortable angle, avoiding strain, and a special
ty-densified cursor runs down the program to
prevent slipping between complex and similar-
looking lines.

It effectively keeps a "finger" on your current
line, especially useful for two-handed
keyboard entries and for use with Sinclair
computers.

Available now only from BUGBEAR (Patent
Pending No. 8222715) — an introductory
price of £12.99 (plus £1.25 p&p)

Quality Software from BRIDGE SOFTWARE LYNCHMOB

for ZX81 with 16K RAM £4.95
for ZX Spectrum (16K) £8.50
Hangman was never like this! A competitive game of skill and strategy for 2 to 6 players. To make things fair, the computer picks turns. If you're the lucky one, you type in a word or phrase. Then the other players guess letters. And look out if they guess wrong, because then the tyrant begins! Great fun! Educational too!

EPHEMERIS

for ZX81 with 16K RAM £8.50
for ZX Spectrum (16K/48K) £7.50
For everyone interested in astronomy. An observer's guide to the universe (1975-2000). Tell EPHEMERIS your position, the date and time EPHEMERIS will tell you the position of the sun, moon and planets in the sky above you plus a whole lot more astronomical information e.g. LST, phase, rise and set times etc. (rise and set times only in ZX81 and 48K Spectrum versions). Results may be printed out on ZX Printer. A triumph of programming skill!

All inclusive prices. Sent promptly by 1st class mail.

Full money-back guarantee. Send s.a.e. for further details.

THE WORKING SPECTRUM

DAVID LAWRENCE

The Working Spectrum

(228 page book)
The first well-documented collection of serious programs for the ZX Spectrum. Programs include a Basic Remuner which can handle Gotos and Gosubs, a character dictionary, a file-handler, several utility programs and a few games. Each program is built up out of re-usable subroutines.

£5.95*

The Working Dragon 32

The Working Dragon 32

This is a companion volume to The Working Spectrum and includes several new features such as a Text Editor and a Music Composer and Editor. Other programs help you use the Dragon 32 as an accountant, for more advanced high resolution graphics, as a home tutor for education and for playing games. Each of the programs and subroutines is explained line by line to help develop your own programming skills.

£5.95

Computing

Best of Popular Computing Weekly

Cassette
Four of the top Spectrum and ZX81 games from Popular Computing Weekly are recorded on this one cassette. The games are Laserchase for the 16K & 48K Spectrum, Kong's Revenge for the 16K & 48K Spectrum, Robot Control for the 16K ZX81 and Alien Attack, a Space Invaders type game for the 1K ZX81.

£4.45

CRUISING on BROADWAY

Cruising (on Broadway)

cassette
Behind the wheel of your machine. Cruising on Broadway — tearing up the strip. You look mean. People stop to stare. Suddenly a black-and-white pulls on to the Broadway behind — its light flashing and siren wailing. The chase is on! Cruising on Broadway is a tyre-burningly fast machine-code game for the 16K & 48K Spectrum. The further you can get the more difficult it becomes — cash prizes in Popular Computing Weekly for the highest scores.

Marvellous Mediocrity

I recently bought a calculator with a square-root facility and integral quartz watch.

Have I bought a calculator with a time-keeping facility, or have I bought a time-keeper with a calculating facility, or did I really buy what I wanted: something to tell the time and something to perform simple calculations?

An alternative would have been to have bought a wristwatch with an integral calculator function — one of those with tiny little buttons you push with a point — but being clumsy I needed big keys. That my purchase was much larger than such a watch (though waler thin, so I was informed) was an advantage, not a disadvantage. To reduce the size of the watch plus calculator to that of a half-penny (new version) is to reduce its appeal — small is a pain!

The trouble with small things is that "In the ant's house the dew is flood" (or so goes an Iranian proverb), and this is very true of electrical devices.

So far, in the short history of computing the trend has been towards miniaturisation. To what extent can this be continued? Or, rather, to what extent *should* this reduction be continued, and in what directions? Ask yourself where many of the problems, and some of the benefits, of small computers lie: in the smallness of the computer.

The popularity of "proper" keyboards for the Sinclair computers, and the many ploys people

use to cool such small microcomputers (remember the old carton of milk caper for the ZX80?) reveal some of the drawbacks. As anybody who has played with crystal sets and simple transistor radios will know, when you place electronic components close to each other interactions begin to take place between the components. If one is not so very careful in the layout of the printed-circuit board, funny things happen — purely by electrical induction you can get a change from what is supposed to happen.

Brian Josephson, a British physicist, developed a new technology in 1962. Called by the generic term "Josephson devices" or "Josephson junctions", these are integrated circuits which act as superconductors at low temperatures (near absolute zero, -273°C). These devices were to be used to develop a (so far) theoretical supercomputer by IBM, which was to be little greater in volume than a Sinclair Spectrum, but immensely more powerful.

My hands are not over-large, but my fingers still prefer a full-size keyboard if I am to use a computer as a computer rather than as a specialised tool. I can see that for particular applications such a specialised tool would have a use, but the beauty of the computer as an artifact is that it is so adaptable. When I see some of the present generation (sorry — present set) of minuscule computers, I wish more thought had gone into the package. It is no use having a superb language or operating system without a proper keyboard, with space around the chips to let them breathe, with (of course) more on the price.

Simply, the argument is that miniaturisation can only go so far in the physical package — humans are not shrinking in sympathy.

It is undoubtedly a good thing that we have moved away from the vast computers — which were every bit as ingenious as our present crop of minuscule machines — but there has now become evident an over-reaction. Small has stopped being good. Small is painful.

I like a machine the size of an Atom, a Dragon, or a Vic. Mediocrity is marvellous!

Boris Allan

Puzzle

Memory question

Puzzle No 42

Jamie had been given some homework to do but, typically, had left it at school.

All he could remember of the question was that it consisted of two two-digit numbers multiplied together and a further one-digit number which was either to be added or subtracted. The result produced a four-digit number with all the digits the same. He also recalled that all the numbers to the left of the equals sign were either all even or all odd.

Jamie drew out the following equation:

$$_ \times _ = \text{****}$$

Can you solve the puzzle for Jamie?

Solution to Puzzle No 37

The answer is: $A = 92$ and $B = 58$.

From the clues given we know that both A and B are greater than 32 as they have four-digit squares. Also A is greater than B by at least ten (Clue 1 across). In the program the values A and B are entered into two *For/Next* loops and interlocking values are checked to see if corresponding digits match.

```
10 FOR A = 42 TO 99
20 FOR B = 32 TO A - 10
30 LET AS = STR$ A
40 LET BS = STR$ B
50 LET CS = STR$ (A + B)
60 LET DS = STR$ (B * B)
70 IF CS(1) <> BS(2) OR DS(3) <> CS(3) THEN
GOTO 120
80 LET ES = STR$ (A - B)
90 LET FS = STR$ (A * B)
100 IF ES(1) <> DS(1) OR ES(1) <> FS(2) OR
ES(2) <> CS(2) OR FS(1) <> BS(1) OR FS(2)
<> ES(1) OR FS(3) <> DS(2) THEN GOTO 120
110 PRINT A,B
120 NEXT B
130 NEXT A
```

Winner of Puzzle No 37

The winner is: Geoff Bogg, Holling Hill Lane, Wickersley, Rotherham, E. Yorks, who receives £10.

AMAZING NEW PRODUCT TELESOUND 84 BBC/SPECTRUM SOUND BOOSTER

Telesound 84 outputs the computer sound direct through your unmodified TV set. Sound effects then can be controlled from a whisper to a roar. Three easy snap-on connections eliminate soldering.

Telesound 84 measures 2½ x 1½ x 1½ cm. and requires no separate power supply. This unique device (patent pending) uses some of the very latest ultra miniature components and costs only **£9.95** inclusive of post, packing, etc.

Full instructions with connection diagrams are supplied so that the unit can be fitted in minutes without any previous experience.

AT LAST! BY POPULAR DEMAND

ONLY
£5.50
inc p&p.

It's been in the PCW top ten for weeks. Now everyone has the opportunity of owning this fantastic new piece of video action software for the 16K ZX81. Make no mistake, you won't have to use your imagination on this one! It's the most faithful simulation of the arcade game SCRAMBLE available. It contains all the phases and adversaries of the real thing. And rockets do not look like alphabetic characters!

Beware Imitations!

Available from Buffer Micro, Streatham; Microware, Leicester; Micro Marketing, selected Spectrum dealers and by post from:

Coloumatic Computing
40 Longfellow Road,
Coventry, CV2 5HB

Stop Press! Coloumatic is ready for the ZX Microdrive! Coming soon, Microware based Dungeon Adventure. Real time hi-res graphics, talk to your adversaries, run away a lot from unspeakably nasty monsters. A surprise guaranteed in every room you enter. (Pleasant surprises not guaranteed!) 100K of sheer terror.

Also coming soon, Spectrum Forth and lots more arcade action!

Programmers!

We offer only the very best in royalties for the very best in real time software. Send us a sample of your work. ZX81, Spectrum, Oric, Lynx, BBC, Atom, etc.
